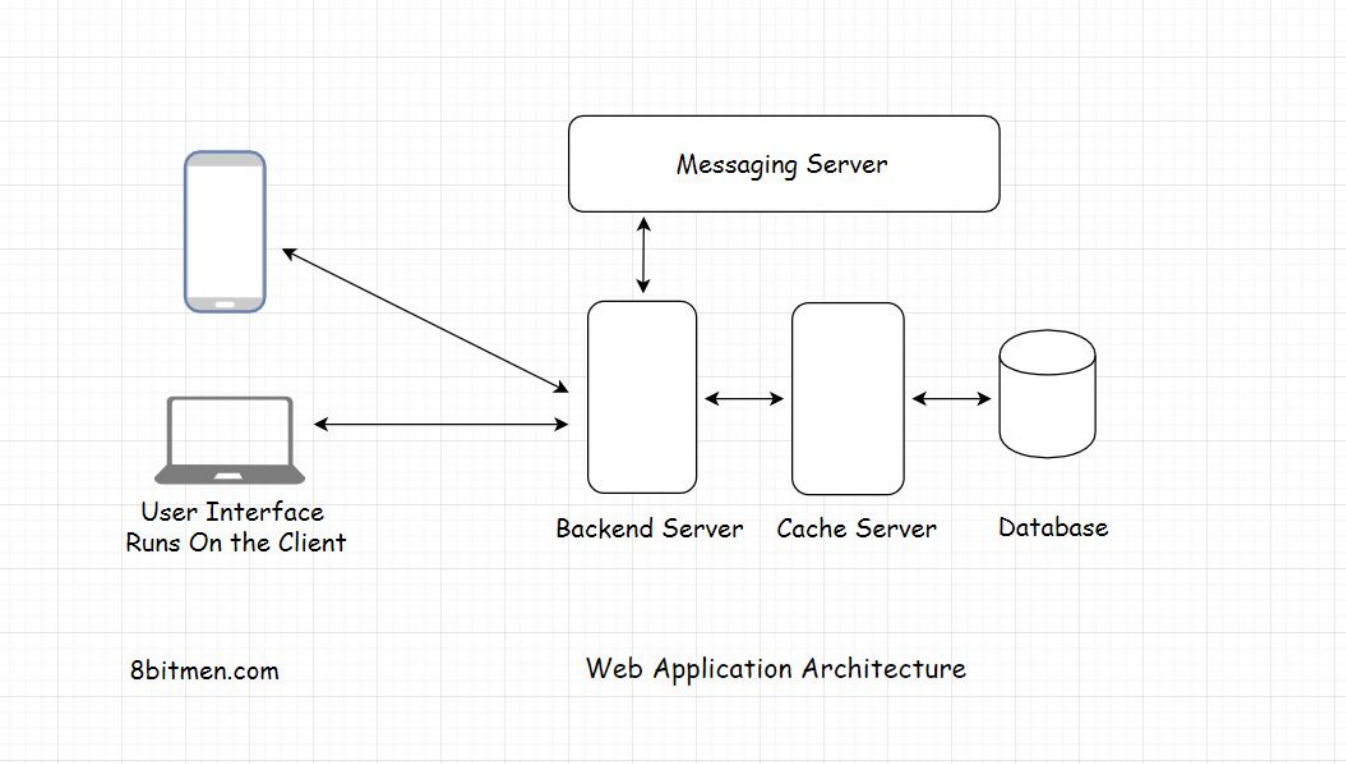
What Is Web Architecture?

In this lesson, we will have a brief introduction to web architecture.

Web architecture involves multiple components like *database*, *message queue*, *cache*, *user interface* & all running in conjunction with each other to form an online service.

In the introduction of this course, I already talked about why the knowledge of web architecture is important to software engineers. Now we will explore it further.



This is a typical architecture of a web application, used in the majority of the applications running online.

If we have an understanding of the components involved in this diagram, then we can always build upon this architecture for more complex requirements.

I'll step by step go through every component starting with the *client-server* architecture.
