

# Quick Quiz!

Let's test our understanding of Kubernetes security components.

1

The sequence of the Authorization stages involved in sending a request to Kubernetes API is:

2

In which of the following process the username is retrieved from the HTTP request?

3

Which of the following authorization method grants (or denies) access to resources based on roles of individual users or groups?

4

Which two components can we combine to allow users to operate only within specific segments of a cluster?

5

In RBAC, a role is a collection of:

6

What do role binding bind?

7

Groups are the same as Users, except that they are validating whether the certificate attached to a request to the API belongs to a specified group.
